BUTTE-SILVER BOW GOVERNMENT  
ENERGY USE PROFILE

A report concerning the energy consumption of the Butte-Silver Bow Government with an energy efficiency plan for all Butte-Silver Bow Government facilities and operations included.

Prepared by  
Thomas H. Pelletier  
Energy Coordinator  
September 1982

Presented to:

Don Peoples, Chief Executive  
Department Heads  
Elected Officials &  
Members of Council of Commissioners:  
David Fisher  
Don Ulrich  
Dale Dart  
Joseph Ivanich  
Chris Carroll  
Margaret Leary  
John E. Jones  
Thomas C. Brophy  
Beverly Hayes  
Dan Rosa  
James R. Casey  
William O'Connor

## ACKNOWLEDGEMENTS

Many organizations and individuals have contributed to the success of the Butte-Silver Bow Energy Management Program. In appreciation of their support and contributions, we would like to thank the following:

Montana State Department of Natural Resources  
and Conservation

Montana Energy Division

National Center for Appropriate Technology

Montana Power Company

Human Resource Council, Dist. 12

North American Indian Alliance

Montana College of Mineral Scinece and Technology

Montana Energy Research and Development Institute

Multi Tech Inc.

Butte School District No. 1

Butte Public Library

Butte-Silver Bow Public Works Dept.

Butte-Silver Bow Budget Office

Montana Standard

KXLF TV

The Butte-Silver Bow Energy Advisory Committee

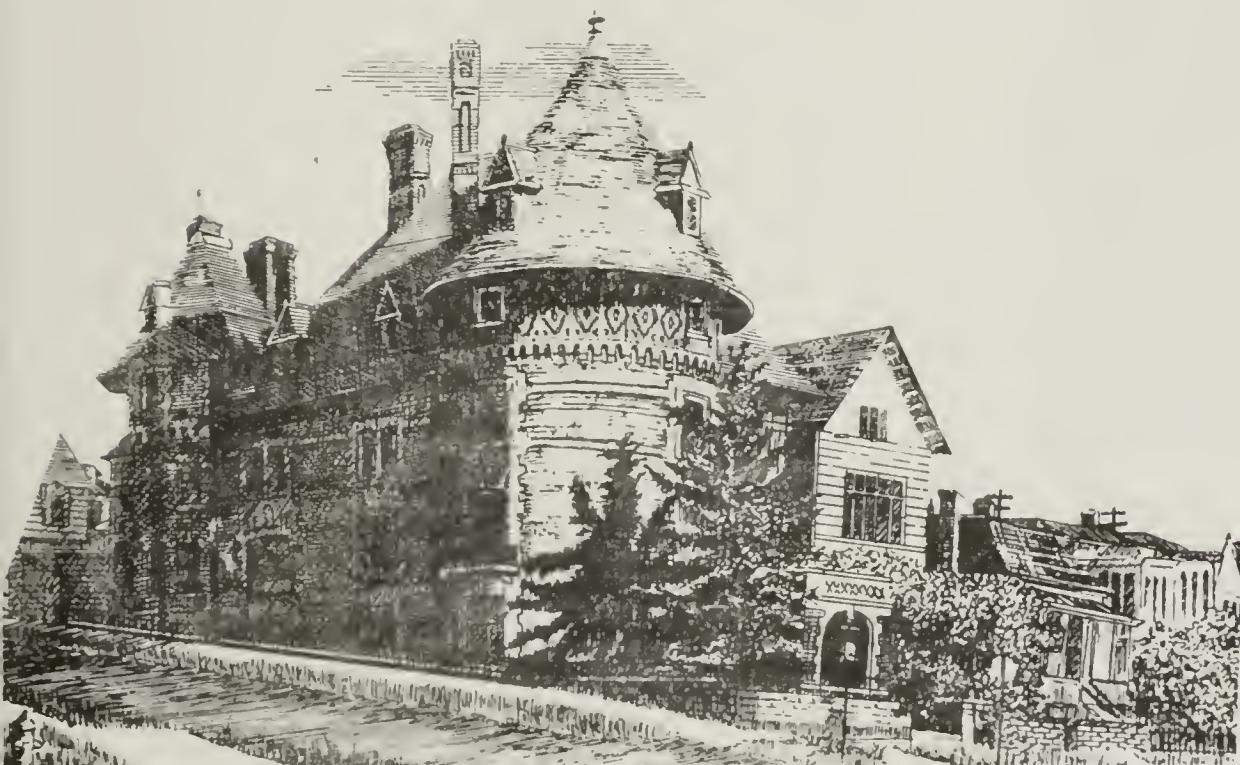

Montana Public Service Commission

Many others have contributed to the energy program, and their time and support is greatly appreciated. Thank you for your continued support.

Special thanks to Kathy Driscoll for contributed artwork, to Kris Ellingson for cover design, to Bill Black for graphics design, to Christina Coleman and Joy Davis for typing and layout work, to the National Center for Appropriate Technology for publication assistance, and to the Montana State Energy Office for the energy grant that has made this program possible.

BUTTE-SILVER BOW GOVERNMENT  
ENERGY MANAGEMENT PROGRAM

PART I: INTRODUCTION

In the spring of 1980, an innovative Energy Management Program was initiated through the combined efforts of the National Center for Appropriate Technology (NCAT) and the Butte-Silver Bow Government. A full-time staff made up of employees from NCAT and the local Gvoernment embarked upon the challenge of moving Butte-Silver Bow on to a course of energy efficiency. Many organizations and individuals were encouraged to cooperate, and their continued support has been vital to the progress of the program. The Montana Power Company, Human Resource Council, Montana Energy Research and Development Institute, Montana Tech, the Butte Public School District No. 1, the Chamber of Commerce, the North American Indian Alliance, the Anaconda Copper Company, and various departments of the Butte-Silver Bow Government, along with many interested individuals, have contributed to make this program a truly community-wide effort.

The energy program was developed out of direct response to rapidly rising energy costs and the related problems that affect the local Government and the entire community. The Butte-Silver Bow Government, with full support of the Council of Commissioners, perceived the need for such a program and set out to formulate an energy management plan that would address the problems of: 1) Local Government Energy Efficiency (internal), and 2) Community-Wide Energy Efficiency (external). This report is the first in a two-part series and deals specifically with the local Government.

A Brief Look At The Problem

Energy is a vital component of an effective, functioning community. The era of readily available cheap energy has abruptly ended, and the cost to individuals, businesses, industry and government will continue to rise. Because energy was cheap and abundant, many of our buildings and systems were designed to use energy in a very wasteful manner. No longer can we afford to waste energy, valuable resources and money.

As energy costs rise faster than most other goods and services and significantly higher than inflation, the problem comes to life. Energy costs demand a larger share of the budget of the local Government and a larger share of an individual's disposable income. More money goes to energy leaving less money for other vital services. The local Government is then faced with the dilemma of raising taxes, cutting services or a combination of the two.

It is most important to realize that the solutions do exist for cutting energy waste and increasing energy efficiency in the Butte-Silver Bow Government. It is, however, going to take a firm commitment from local Government department heads, elected officials and all employees.

Problems and specific solutions do exist and will be presented in greater detail in following sections.

### The Birth of Community Energy Management in Butte-Silver Bow

Jim Benson, of the Institute for Ecological Policies in Fairfax, Virginia and the co-author of the County Energy Plan Guidebook spent two weeks in Butte in April-May, 1980. Mr. Benson, on contract with NCAT, helped to design the foundation of the Butte-Silver Bow Community Energy Management Program. NCAT appointed Tom Pelletier, Community Energy Management Specialist, as the project coordinator with the approval of Don Peoples, Butte-Silver Bow Chief Executive. An Advisory Committee was formed with representatives from business, industry, government, research, historical preservation, education, the media, low-income and the utility company. After several meetings and the dissemination of educational materials to the public, a work plan was developed with goals and objectives.

The energy team, made up of employees from NCAT and Butte-Silver Bow, worked on collecting, assimilating and analyzing energy use data for all sectors of Butte-Silver Bow. A great deal of effort was put into organizing, educating and informing the general public of energy problems and solutions. Butte-Silver Bow assumed the role as the leader in energy conservation in the County. The Butte-Silver Bow Government decided that it would get its own energy house in order and serve as an example of energy efficiency for the rest of the community. An Energy Office was opened on the first floor of the Courthouse to serve the people of Butte with free literature and technical assistance. The service was expanded to the Butte Public Library in order to serve the people more fully. The Library now has many new books dealing with various energy topics and about 40 films on energy which are available to the public.

The Butte-Silver Bow Community Energy Management Program submitted an application for a grant from the Montana Energy Extension Service. The proposal was successful and a grant for \$20,000 was awarded to Butte-Silver Bow for one year with a \$10,000 supplemental grant for the following six months. The grant made it possible to fund a full-time Energy Coordinator and open up a full-time Energy Office in the Courthouse. Tom Pelletier, part-time Energy Coordinator on loan from NCAT, was awarded the position and continuity was maintained in the program. The Energy Coordinator's position was established directly under the Chief Executive's Office and reports to the Chief Executive and the Council of Commissioners.

The challenge made upon the Butte-Silver Bow Energy Office is to increase the energy efficiency of the Government facilities and operations and to encourage energy efficiency in all sectors of the community. Additional funding from the Butte-Silver Bow Government with in-kind services donated from NCAT, the Montana Power Company and the Human Resource Council have combined to make the energy program a shining example of community cooperation and energy efficiency.

## What Is An Energy Use Profile

This Energy Use Profile is presented in an attempt to give complete documentation of Butte-Silver Bow's energy consumption over a period of years. In most cases, energy consumption data is available on an historical basis from 1978 to 1981 with general energy flow data available back to 1960. Projections have been made out to the year 1990 in order to give estimated figures on energy costs in the near future.

Energy consumption data is presented accordingly:

Electricity--measured in KWH (kilowatt hours).

Natural Gas--measured in MCF (thousands of cubic feet).

Motor Fuels--gasoline and diesel measured in gallons.

Propane--measured in gallons.

An analysis of each building and facility has been conducted for Butte-Silver Bow. The actual amount of electrical energy and natural gas has been recorded, and the cost per year of each facility has been analyzed. Energy audits have been completed on the major buildings to provide valuable information about the way a particular building uses its energy and to pinpoint energy saving measures. An energy audit requires an on-site examination of the facility with a focus on the structural design and orientation of the building, floor space, heating system, ventilating system, wattage of light bulbs, window area, building material, etc.

The Energy Use Profile takes into account the past and present energy bills and makes projections in order to show future costs of energy. The importance of this study is in showing the seriousness of energy cost escalation and to prove that energy conservation investments are not only worthwhile, but very necessary to the proper functioning of the local government in the future.

## PART II: ENERGY DATA COLLECTION AND ANALYSIS

Energy consumption data has been collected and analyzed for over two years for Butte-Silver Bow. The Budget Office is now recording all major energy accounts by computer, and we are now able to analyze each building's monthly energy consumption. Motor fuel consumption is also being recorded as the shipments of fuel are purchased and delivered. A mini-computer records all gasoline (regular and unleaded) as it is dispensed through the card key (Gas-Boy) gas pump system. All motor fuels are stored and dispensed in one location at the Maintenance and Service Center behind the Civic Center.

Accurate energy consumption data is extremely important to Butte-Silver Bow for several reasons:

1. for budgetary planning and forecasting;
2. for justification of energy conservation and renewable energy expenditures;
3. for accurate record keeping of actual energy costs;
4. for record keeping of savings due to energy conservation measures; and
5. for early detection of abnormal increases or decreases in energy consumption.

In the past, energy costs were a small part of the overall budget of Butte-Silver Bow. Every year, energy costs are increasing and taking a larger percentage of the available budget. An understanding of energy consumption and future energy costs is vital for effective planning and to the future of our community.

#### Total Energy Consumption For Butte-Silver Bow

Table 1-A presents energy consumption and revenue generated by the Montana Power Company in the Butte area. The number of customers, the amount of natural gas and electricity consumed, and the total revenue generated is all accurately presented. The number of customers has been fairly consistent, while there has been sharp decreases in natural gas consumption and the definite steady increases in electricity consumption.

Table 1-B shows the number of registered vehicles in Silver Bow County and the number of gallons of gasoline sold in the county. Generally, vehicle registrations have increased, meaning there are more vehicles (passenger cars and trucks) in the county. The amount of gasoline sold in the county had increased from 1960 to 1971 when it peaked out at 25,284,652 gallons. Since 1971, there has been a steady decrease of gallons of gasoline sold in Butte.

It is important to understand the energy consumption patterns in the Butte-Silver Bow area in order to place the government energy expenditures into the right perspective. For not only are we talking about a problem being faced by the local government, but it is a problem that all consumers are faced with. The entire community will be more and more affected each year as is pointed out in Table 1-C. The energy consumption data and cost figures for 1979 are accurate, while 1969 numbers are actual cost figures based on the 1979 levels of consumption. The 1989 figures are estimates based on the same level of consumption as 1979. The large increase from \$20 million to over \$202 million in 20 years brings up many serious problems for our local economy.

## Butte-Silver Bow Government Energy Consumption

Table 2-A is presented in order to document energy consumption for Butte-Silver Bow government facilities. Accurate information is available on most of the facilities from 1978 to 1981. The energy consumption data and costs have been presented by calendar year totals. These figures can easily be adjusted to reflect fiscal year totals. A breakdown of the energy consumption of the nine volunteer fire stations is presented for 1981 in Table 2-B.

Projections for natural gas and electricity costs (2-C & 2-D) are based on forecasting done by the Montana Power Company and presented to the Montana Public Service Commission in 1982. Projections for 1982-1990 are based on the same level of consumption as 1981. Since 1981 was a mild year for weather and heating needs were low, it is possible that the projected energy consumption could be higher during a severe heating season. These projections are based on the assumption that the efforts made by the Energy Management Program and the increased awareness of the Butte-Silver Bow employees will reduce unnecessary energy waste.

Holding energy consumption at 1981 levels is one thing, but as the Tables clearly point out, the costs of that energy in future years will be increasingly difficult on the local government budget. One must keep in mind that these figures will be drastically affected by the closing of facilities such as the selling of Silver Bow General Hospital or the addition of any new facilities such as the new Asphalt Recycling Plant.

## Government Energy Costs Past, Present & Future 1978-1990

Virtually all of the government facilities can be improved for energy efficiency. There are many ways to tighten up the buildings, improve heating system efficiency, upgrade energy management practices, and incorporate new technological developments for the purpose of energy efficiency, and saving money. An investment will have to be made to achieve significant energy efficiency levels of operation. A 30% reduction in present levels of energy consumption is possible through complete weatherization of all buildings and increased efficiency of all systems. Table 2-E presents actual energy costs for 1978 to 1981 with projections for 1982 to 1990. An estimated 30% reduction in energy consumption for accumulated savings could be very significant and can prove the value of investing in energy conservation measures. Accumulated energy savings from 1983-1990 could be more than \$1,750,000 if a thorough energy conservation program was implemented in buildings and facilities. Additional savings could be possible through energy efficiency efforts in street lighting and vehicle management.

The energy projections for costs and savings on Table 2-E are only for buildings and facilities. The picture for future energy costs gets more serious when we consider motor fuel consumption (gasoline and diesel) and calculate in the projections based on U.S. Dept. of Energy forecasts. D.O.E. estimates motor fuels to increase by 15% per year from 1982-85 and 12% per year from 1986-90. The same forecast is assumed for propane. If fuel consumption remains constant at the 1981 level of 173,361 gallons, the price increases will drastically affect Butte-Silver Bow's budget. Graphs are used to more clearly show the impact of escalating energy prices.

<sup>1</sup>All prices are in \$/Mcf. The firm price is forecasted on the basis of the pressure base equivalent cost of the interruptible class.

<sup>2</sup>"Real" refers to the prices being stated in terms of 1972 dollars. That is, general inflation has been removed and 1972 is the base year of the index (i.e., 1972 = 1.00). The Implicit Price Deflator for Personal Consumption was used as the index for the Residential class while the Producer Price Index for Finished Goods was used for the utility class. The forecasts for both indices were obtained from Data Resources, Inc.'s "U.S. Long Term Review, Winter 1981-82."

<sup>3</sup>"Nominal" refers to actual dollars or dollars from which inflation has not been removed.

<sup>4</sup>The "%" column refers to the year to year change in nominal prices.

\*1978-1981 present actual consumption cost figures

\*\*Cost decreases for 1981 reflect the selling of Silver Bow General Hospital

<sup>k</sup> 1982-1990 figures are projections based on Montana Power Company forecasted prices at the 1981 level of consumption. This graph is presented in an attempt to show how serious energy costs will be in the future. If nothing is done to improve energy efficiency, the energy costs will be staggering. With the adoption of an overall energy efficiency program, at least 30 percent savings could be realized. The yearly savings and the accumulated savings columns present very impressive reasons for supporting energy efficiency efforts in Butte-Silver Bow.

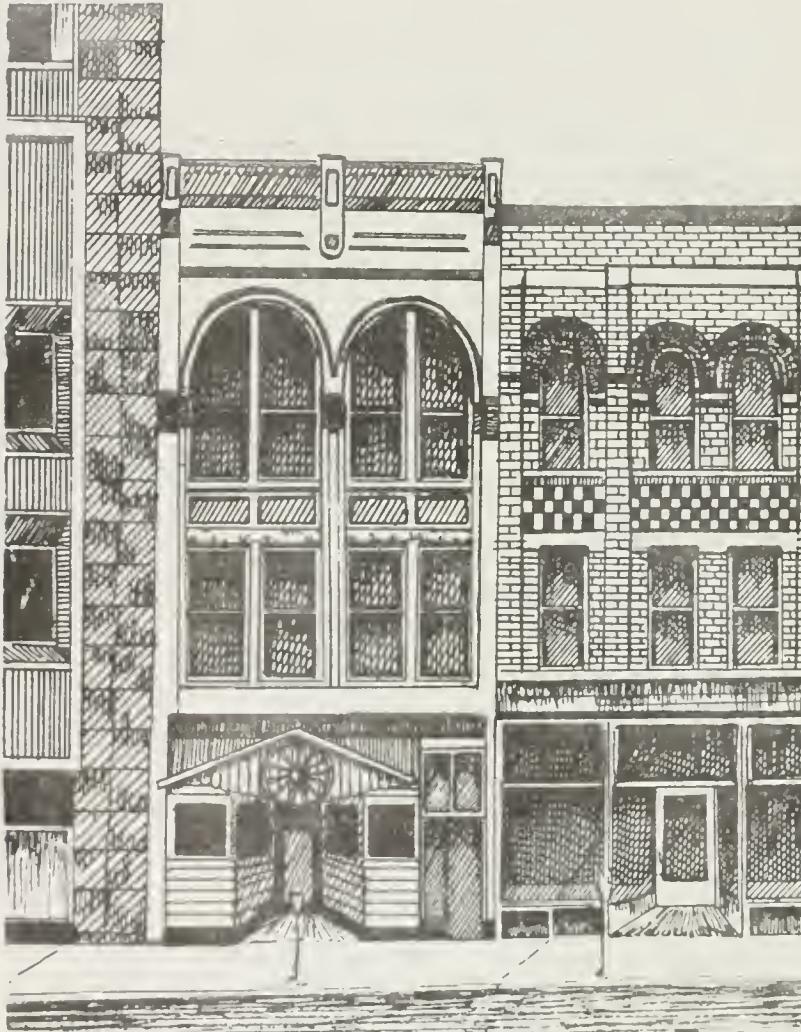

Caution! Cost projections for 1982 through 1990 assume the same level of consumption as 1981. 1981 was an unusually warm year with a total of 8,183 heating degree days compared to the average for Butte of 9,719 heating degree days. This would not have a big impact on electricity consumption but definitely has had a significant impact upon natural gas consumption. In order to meet these cost projections the level of consumption for electricity and natural gas will have to be kept under control and even cut back.

In Table 2-F, monthly totals for 1981 are presented for regular, diesel, and unleaded fuel. In Table 2-G, the total gallons of gasoline and diesel for 1981, 173,361, are figured in with other energy costs, and totals for each year are projected out to 1990. Propane costs are also figured into this table. For budgetary purposes, the energy costs for each facility have been calculated on a fiscal year basis. Table 2-I is presented to show the actual 81-82 fiscal year energy data for each of Butte-Silver Bow's major facilities. Projections for the 82-83 fiscal year are presented with estimated decreases in consumption and the calculated costs based on MPC projections for the year.

Street lighting costs must be added into the picture to provide the complete listing of Butte-Silver Bow's energy expenditures. Table 2-H presents street lighting costs (actual) for 1978-81 with projected costs to 1990 assuming the 1981 level of consumption. These projections are also based on Montana Power Company forecasts. When all energy costs are figured in together, the Butte-Silver Bow Government had to pay \$691,010 in 1981. The same amount of energy will cost about \$1,388,705 in 1985 and \$2,140,351 in 1990.

A serious effort will have to be made to reduce the level of consumption of all energy types by all departments. The economic stability of the Butte-Silver Bow Government is at stake.

### PART III: PLOTTING A COURSE FOR ENERGY EFFICIENCY

Energy conservation is a very effective way of cutting energy costs. In Butte-Silver Bow, we have seen the fruits of the labors of energy conservation by examining the cut-backs in energy consumption in the various sectors. Individuals, businesses, industry, churches, schools, non-profit groups, and the local government have all cut back on energy waste and increased energy efficiency. The main impetus for conservation taking hold has been simple and logical economics. As the costs of energy rise, conservation becomes more and more attractive. Two years ago the expense putout for a particular energy conservation measure may have paid for itself in four or five years. Now the same energy conservation measure may pay for itself in two years due to recent increases in prices.

Conservation not only saves money, but it helps to promote a cleaner, healthier, and safer environment, and it is more reliable because one is not so dependent on large supplies of imported energy. Conservation is also a good idea because we are preserving valuable energy for future years. The cost of investing in conservation is easy to justify by looking at payback times and life-time savings. It is even more inviting when the costs of conservation are compared to the costs of new electrical generating plants.

One million BTU's saved through energy conservation is about one-sixth the cost of producing one million BTU's through a new electrical generating plant. This information is according to a Bonneville Power Administration study done by the consulting firm of Skidmore, Owings, and Merrill.

#### 30% Savings for Buildings & Vehicle Fleet

Butte-Silver Bow's government buildings are in need of thorough weatherization in the form of ceiling and wall insulation, window treatment, air infiltration prevention, pipe insulation, and general repair and maintenance work. In addition, all mechanical systems should be tuned up, improved and maintained for optimum efficiency. All heating and ventilating systems should not only be tuned up and upgraded as soon as possible, but then should be maintained to operate at their most efficient operating level; just as an automobile needs to be maintained and tuned up.

There is one other element that must be considered in the overall energy management plan, and that is the human factor. It is people who consume energy, and it is people who must be willing to conserve, to help out, and to do their own part. The energy problem is one that will be with us for a long time, and it is a problem that must be dealt with by many people in order to reach solutions.

A 30% savings in energy consumption is possible in government facilities by adopting an energy plan that takes into account the following three factors:

1. Human Element-People must be willing to cooperate and do their part to be a part of the solution. Energy Awareness seminars and workshops can be conducted, and information can be provided to all employees. Dept. heads must take the lead and demand conservation policies be upheld.
2. Weatherization-All buildings and facilities must be tightened up, insulated, and improved to reduce heat loss and increased overall energy efficiency.
3. Heating & Ventilating/Mechanical Systems-The heating and ventilating systems must be improved for optimum energy efficiency. The way some of them are working now is very inefficient and wasteful. The Courthouse boiler and heat distribution system is in need of major repairs. The Civic Center System needs some improvements on its heating distribution system, and every building could use some improvements.

All three of these elements are necessary to achieve the full benefits of an energy conservation program in Butte-Silver Bow. Each building and facility has been analyzed and overall about 30% energy savings could be realized with a complete conservation effort. In addition, 30% savings could be realized by increasing efficiency in the vehicle fleet.

The previous tables pointed out the large savings that are possible through a serious and dynamic energy conservation program. The investments made in conservation today will pay for themselves over and over again and actually will save large amounts of money for the local government. The 30% reduction in motor fuels could come from a combination of efforts: 1) A reduction in the number of vehicles from the present 100 to the number that is strictly essential for effective operations. Other ways to cut vehicle fuel consumption are presented under Recommendations.

Energy costs in the future will become a very critical matter for the Butte-Silver Bow government. Actions must be taken now to ward off the dangers of energy costs getting out of hand. There are a wide variety of solutions to implement in the various facilities. The following recommendations should be pursued and implemented as soon as possible.

#### General Recommendations

- Thermostats should be set at 65-68° during the heating season, set back to 50-55° at night, weekends, and other off hours.
- Air conditioning should be set at 78° in the cooling season and shut off at night, weekends, and other off hours.
- Ventilating systems should be shut off during off hours.
- Infrequently used rooms should be closed off and the heat turned down to 50-55° when not in use.

- Drapes, blinds, and shades should be utilized wherever possible by closing them at night and weekends during the winter and opening during the day.
- Heating should be turned back one-half to one hour before the end of the work day and turned up in the morning when necessary.
- Lighting should be turned off when not in use. It is cheaper to turn lights off even for a few minutes than to leave them on.
- Turn off all typewriters, radios, and other office machines when not in use, leaving for lunch, and anytime they will not be in use for more than a few minutes and certainly turn everything off at the end of the day.
- Use natural light, from windows, whenever possible.
- Incandescent lights should be replaced with fluorescent lighting wherever possible.
- Task lighting wherever possible is more efficient and provides better lighting than lighting up an entire room.
- Lighting levels in hallways and corridors should be reduced to a minimum safe level.
- Hot water heaters should be set at 105° wherever possible.
- Adopt a set of policies for the Public Works Department, Police Dept., Government Buildings, Fire Dept., Community Development Dept., Planning Dept., Airport, and all others that will support and encourage energy conservation and efficient operations in all areas of local government.

### Savings In Government Buildings

Implementation of energy management techniques and low-cost/no-cost energy conservation applications have saved the Butte-Silver Bow government significant amounts of money in the operation of government facilities.

Approximate savings have been realized on the following facilities from 1979 thru 1981:

<u>Building</u>	<u>% Savings</u>	(for 2 years) <u>Total \$ Savings</u>
Courthouse & Jail	14%	\$14,448.00
Civic Center	3%	3,236.00
Library	14.4%	2,024.00
Community Center	17%	4,725.00
Archives (change of operation)	64%	1,114.00
Stodden Park Pool	10.5%	2,480.00
Public Safety	1.5%	361.00
Fire Station #2	9.4%	916.00
TOTAL		<u>\$29,304.00</u>
Estimated 1982 Energy Savings for first 6 months of the year		<u>\$18,350.00</u>
Total Savings Since 1979 in Government Buildings		<u>\$47,654.00</u>
Additional savings have been made in vehicle fuel consumption of 4% from 1980-82 fiscal years		<u>\$ 7,728.50</u>
TOTAL SAVINGS		<u>\$55,382.50</u>

## SPECIFIC ENERGY CONSERVATION INVESTMENTS

*Costs and savings are calculated for 1982 estimated costs and 1982 energy prices.*

ENERGY EFFICIENCY MEASURE	CAPITAL COST & FINANCING PLAN	SAVINGS (approx.)	RESPONSIBLE OFFICE	PAYBACK TIME
<u>Courthouse &amp; Jail</u>				
● Install forced draft burner (Marc II Commercial/Industrial or equivalent) on main gas steam boiler.	\$ 19,500	20%	Government Buildings & Energy Office	2-2½ yr.
Reduce fire box size of old coal boiler for more efficient gas burning.	\$1,752.10/month or 24 months @ \$1,011/month			
Replace controls and valves to accommodate new forced draft system and tune up complete system.				
● Back all radiators with 1/8" foil-faced radiator reflectors to prevent heat loss to outside walls. (95 radiators--1,500 ft <sup>2</sup> of reflector.)	\$ 1,850 Payment upon completion/job	3-5%	Government Buildings & Energy Office	1-1½ yr.
● Caulk and seal all skylights. Seal off 4 light well/skylights on roof, seal off large skylight in Clerk of the Court's upper deck, caulk outer main dome and 7 other skylights.	\$ 5,150 Payment upon completion/job	3% on energy + savings/bldg. maintenance		4 yr.
● Install storm front/vestibules on 2 main entrance doorways (not revolving doors). Bronze frames & tempered glass to be installed as air lock inside building.	\$ 3,650 Payment upon completion/job	2½+ increased comfort level for 1st floor offices	Government Buildings & Energy Office	3½-4 yr.
● Insulate all upper windows with Sentinel window insulation or equivalent--1,968 ft <sup>2</sup> ; windows cleaned and caulked; window insulation placed in rooms with excessive glass--900 ft <sup>2</sup> .	\$ 5,320 Payment upon completion/job	2½-3%+ increased comfort level	Government Buildings & Energy Office	4-5 yr.
● Weatherstrip doors, caulk windows, replace broken or cracked glass, reputty loose windows.	\$ 1,580 Upon completion	4% + increas. comf't level	Government Buildings & Energy Office	1 yr.
● Close off top of 2 main structural columns and seal tight to reduce heat loss.	\$ 200	1%	Govern. Bldg. & Ener. Off.	1 yr.

ENERGY EFFICIENCY MEASURE	CAPITAL COST \$ <sup>3</sup>	SAVINGS (approx.)	RESPONSIBLE OFFICE	PAYBACK TIME
Courthouse & Jail (cont'd)	FINANCING PLAN			
● Insulate all basement heating pipes.	\$ 900	1%	Government Buildings & Energy Office	2 yr.
● Install energy management control system with 50-55 day/night room thermostats and 150 new valves with complete pneumatic control system including compressor, 7-day clock, all pneumatic piping.	\$50-60 thousand	20-25%	Government Buildings & Energy Office	4 yr.
● 1-2 yr. payment plan. 1st yr.-1st & 2nd fl. completed; 2nd yr. 3rd & 4th fl. completed. (paymnt. every 6 mo.)				
● Energy Management Service Contract	\$ 700/year	2% + better maintenance & control	Government Buildings & Energy Office	$\frac{1}{2}$ yr.
Note: See following list of Energy Conservation Measures	Courthouse TOTAL <u>\$88,150</u>			
<u>Civic Center</u>				
● 8 new damper ventilating units installed to replace broken relief dampers on rooftop including all necessary controls.	\$ 4,570	10%	Government Buildings & Energy Office	$\frac{1}{2}$ yr.
Ceiling fans adjusted to circulate inside air & reduce amount of outside air brought into building.	Payment plan available			
● Install 2 5000 watt fan forced wall-mounted heating units with thermostat in Civic Center Mgr. Office and Recreation Office. This will eliminate the need to bring heat all the way from main boiler in rear of building.	\$ 1,200	10%	Government Buildings	$\frac{1}{2}$ -1 yr.
● Insulate all exposed heating pipes.	\$ 2,600	5%	Government Buildings	1-2 yr.
● Insulate windows & install inside storm windows including caulking on Mgr. Office & Recreation Offices.	\$ 1,450	1% + incr.	Government Buildings & Energy Office	4 yr.
Note: See following list	Civic Center TOTAL <u>\$9,820</u>

Note: See following list

20,000

Uncertain

Government  
Buildings

1 yr.

## ENERGY CONSERVATION MEASURES

### Courthouse & Jail

- Close the doors to the offices on first, second, and third floors in order to keep heat in rooms and prevent heat from escaping out into the rotunda.
- Utilize insulating blinds and curtains to insulate windows, especially on the north side.
- Replace remaining incandescent lights with fluorescent fixtures and turn off all unnecessary lighting in the halls and unoccupied areas.
- Disconnect ballasts where lamps have been removed and remove lamps where practical. Replace burned out lamps with more efficient types of lamps.
- Clean lights and fixtures on a regular basis.
- Install locking thermostat cover in the jail.
- Insulate the ceiling/roof of the jail.
- A system of testing and record keeping should be initiated immediately to insure proper and efficient boiler operation. Stack temperatures and flue gas analysis should be taken on a regular basis and adjustments made periodically for most efficient boiler operation.

### Civic Center

- Reduce thermostat settings when arena area is not in use and at night for entire building. Utilize separate unit space heaters in work/office areas.
- Turn down heat in all lobbies, hallways and restrooms to 55° maximum.
- Keep accurate records for all motors and motor driven equipment and insure proper maintenance procedures.
- Replace incandescent lamps with most energy efficient types such as fluorescent or high pressure sodium lamps.
- Clean all lamps and fixtures on a regular basis.
- Keep lights turned off in unoccupied areas. When cleaning or working in a specific area, attempt to light only that area instead of entire building.
- Install caulking and weatherstripping on all windows and doors.
- Insulate the roof.
- Boiler should be tested regularly for proper flue gas analysis and stack temperature. The system should be maintained to operate at most efficient level.

Library

- Clean lights and lighting fixtures regularly.
- Test furnace efficiency periodically and maintain most efficient operation of heating system.
- Install locking thermostat covers on thermostats.
- Change to more efficient 35-watt fluorescent tubes instead of 40-watt. Replace burned out ballasts with more efficient energy conserving ballasts.
- Use quality weatherstripping and caulking on windows and doors.

Public Safety Building

- Install solar hot water system to meet hot water needs of the building.
- Install locking thermostat covers on thermostats.
- Change to more efficient 35-watt fluorescent tubes instead of 40-watt. Replace burned out ballasts with more efficient energy conserving ballasts.
- Maintain hot water temperature at 140° and no hotter.
- Fire engine doors should be kept closed whenever possible during heating season.

Community Center

- Install window insulation.
- Install air conditioning unit in kitchen area and proper ventilation.

Maintenance & Service Center

- Overhead doors should be kept closed whenever possible during heating season.
- Install more efficient lighting such as high pressure sodium lamps.
- Install air circulation devices to circulate warm air from the top of the room to the bottom.

South Side Fire Station

- Install solar hot water system.
- Install locking thermostat covers on thermostats.

## ENERGY CONSERVATION MEASURES

(cont'd)

### South Side Fire Station (cont'd)

- Install more efficient fluorescent tubes and ballasts in all lighting fixtures.
- Keep lights off in unoccupied areas and when not necessary.
- Remove two lamps and disconnect ballasts from four lamp fixtures.
- Add roof insulation to increase building efficiency.
- Energy efficiency analysis on all Butte-Silver Bow Government facilities should continue. Special attention must be given to the Metro Sewer Treatment Plant, the new Asphalt Recycling Plant, the Airport Terminal, Stodden Park complex, the 8 Volunteer Fire Stations, and all other buildings and operations.

## ADDITIONAL ENERGY CONSERVATION MEASURES

- Heat Reclaimer-Thermastat system and other heat recovery devices to be analyzed for all boilers to increase energy efficiency.
- Moto Mizer units and other energy efficiency units to be analyzed for electric motors, especially for metro sewer treatment plant.
- Complete Energy Management Computer system to be investigated for controlling all energy consumption in all buildings and facilities. Cost estimate--\$250,000. This could be justified as energy prices escalate. The state capitol and Missoula County have installed similar systems. A possible cost sharing program with Butte School District No. 1 will be pursued.
- Butte-Silver Bow Transit system should be promoted. As gasoline prices increase, the bus system will provide a valuable service to the citizens of Butte-Silver Bow.
- The new Asphalt Recycling Plant will save energy and money in the form of old oil being reused as new pavement.
- A solar hot water heating system should be considered for the Stodden Park Pool. Cost estimate--\$25,000 (to supply all hot water needs).
- The Metro Sewer Treatment Plant has initiated an energy efficiency program and all efforts should be made to continue efficiency efforts at the plant.
- A waste to energy plant will be investigated as many communities burn their garbage in modern incinerators to produce heat and electricity.

ADDITIONAL ENERGY CONSERVATION MEASURES (cont'd)

- Removal of 4-way stop streets is a good example of increasing energy efficiency for the community and increasing traffic flow efficiency. (Removal of nine 4-way stops saved residents approximately 45,569 gal./gas for an annual savings of \$56,836.)
- All volunteer fire stations should receive energy audits and recommendations.
- Solar energy heating will be analyzed for all government buildings.

Street Lighting-Public Works Dept.

- Montana Power has proposed large increases in street lighting rates. Street lighting should be made more energy efficient by the installation of high-pressure sodium lighting. All new lighting districts should be high-pressure sodium only which are four times as efficient as incandescent lights. A working relationship with Montana Power, the State Energy Office, the Montana Consumer Council, and many cities and towns has been organized to come up with a plan to provide the most efficient street lighting at the least possible cost.

Vehicle Fleet-Public Works Dept.

- The conversion of vehicles to propane and to compressed natural gas (CNG) fuel has been investigated. The CNG and propane options look very good for Butte-Silver Bow's fleet. The Montana Power Company is presently converting many vehicles to CNG and they are eager to sign on new customers and to stand behind the conversion process.

The conversion of 20 vehicles to CNG and the refueling station would be \$73,831 and would cut fuel costs by 50% or a savings of over \$26,000 the first year. The system would pay for itself in less than three years, and innovative financing is available.

- Police vehicles should be adopting a policy of parking vehicles in designated areas for a certain amount of time each hour (15-25 min.) or whatever could be safely justified.
- All vehicles should be maintained properly for most efficient operation and big gas guzzlers should be weeded out for more efficient running vehicles.
- All engines should be turned off in vehicles when not necessary.
- Traffic control could be made more efficient by switching to red or yellow blinking lights late at night and wherever safe.

## POLICIES & PROCEDURES FOR ENERGY EFFICIENCY

- Planning Department should adopt energy efficiency considerations for buildings, zoning, solar access and overall planning procedures.
- Community Development Dept. should continue to promote more energy efficiency in housing rehabilitation and community development projects.
- The Energy Office should continue to develop more energy conservation practices for the Butte-Silver Bow Government and for the entire community.
- Activities of the Bonneville Power Administration and the Montana Power Company will be monitored for cooperative efforts as we work together for a stable energy future.

## PART IV: ACTIVITIES ACCOMPLISHED BY THE BUTTE-SILVER BOW ENERGY OFFICE

Many activities have been accomplished since the energy program started vigorously in the spring of 1980. The following listing is a partial description of major activities over the past two years.

### Education/Public Information

1. The establishment of the Community Energy Management Program Advisory Committee brought people together from various backgrounds and beliefs to discuss our energy futures.
2. Close contact was made with many state agencies and other local energy management programs from across Montana and across the country.
3. An energy merchants directory was put together to inform people about local dealers in energy saving products. The directory also helped to promote local businesses and many discounts have been offered to the public.
4. Assistance has been given to many organizations and individuals--locally, around Montana, and throughout the U.S. on various energy matters.
5. The Butte-Silver Bow Energy program has been featured in several national publications and national conferences because of its well-rounded and thorough program.
6. A technical advisory committee has been organized for support on energy projects.
7. A public information office was established in the Courthouse with free literature and assistance.
8. The Butte Public Library set up an energy information center with free literature, many new energy books, and many energy films available to the public.
9. Many energy programs have been conducted throughout Butte's schools and have been successful.
10. Community seminars and workshops have been conducted on a wide variety of energy topics to help people cope with their energy problems.
11. Door-to-door energy information campaigns were conducted and reached about 10,500 households in Butte-Silver Bow.
12. Energy surveys were conducted to test people's attitudes toward energy problems and to spread energy conservation ideas.

14. Energy Awareness Week, Get Ready for Winter Campaign, Sun Day, and other special events were organized to raise the level of awareness of the people about energy matters.
15. There has been a great deal of participation in state, local and national meetings, conferences and idea exchanges by Butte's Energy Program representatives.
16. Presentations have been given to many community groups concerning energy problems in Butte-Silver Bow and energy conservation solutions. This has been a valuable public service and is on-going.
17. Brochures, handout materials, and several copies of a newsletter--"The Baseline"--were developed and distributed to the public.
18. A large quantity of free literature has been distributed throughout Butte-Silver Bow. Free materials (books, pamphlets, posters, brochures, papers) were supplied by Montana Power, NCAT, D.O.E., the State Energy Office, and others.
19. A cooperative effort with the National Center for Appropriate Technology for training people in community energy management techniques was conducted.
20. Several energy slide shows have been developed on conservation and particularly on Butte-Silver Bow and energy programs in Montana.

#### Technical Assistance Research

1. Data collection and assimilation for all of the six sectors (residential, commercial, industrial, institutions and non-profit organizations, transportation, and local government) has been conducted.
2. Energy audits were accomplished on all major Butte-Silver Bow facilities.
3. Energy audits were conducted on all Butte schools. This effort was coordinated by the Butte Energy Program.
4. Low-cost and no-cost energy conservation measures were implemented in many government buildings.
5. Energy audits were accomplished on many churches, several businesses, the YMCA, NCAT, and other non-profit groups' facilities.
6. Assistance is offered to individuals and groups who are seeking help with energy problems.
7. Data collection through the use of Montana Power Company's computer was secured to provide energy data on specific buildings and accounts.

8. Energy-saving recommendations were developed for the commercial and residential sectors.
9. A wide variety of energy conservation measures have been implemented at the Courthouse, Library, Civic Center, Metro Sewer, Public Safety, and Community Center. Energy conservation measures such as rescheduling janitorial services to close buildings down at night and educating employees to turn out lights and machines when not in use cost nothing to implement, but can actually save large amounts of energy. Other energy conservation measures like insulating the hot water tanks at the Civic Center, Stodden Park Pool and Mercury St. Fire Station, installing a vestibule doorway on the Public Safety Building, insulating some windows at the Courthouse, installing inside storm windows and boiler tune-up work all cost money, but save significant amounts of energy.
10. Investigation into the potential for renewable energy development in the Butte area has been pursued, showing that weatherization and energy conservation is the top priority. Solar energy potential is significant and should be promoted and utilized for water heating and space heating. Wood heat is a growing energy source and should be promoted in a safe and healthy manner. Small scale hydro-electric generation has limited potential as does wind power in certain parts of Silver Bow County.
11. A study has been conducted on overall energy consumption patterns for all sectors of Butte-Silver Bow. This study includes an analysis of the socioeconomic conditions in Butte-Silver Bow, an analysis of labor force and market conditions and forecasts of future energy demands and costs in this area.
12. The Butte Energy Office has been assisting the Community Development Dept. on the solar systems that are part of the HUD rehabilitation project in the central Butte neighborhood. The specifications for solar hot water and hot air systems were drawn up and bid requests let out. The review process of 13 different solar systems was conducted and the first three solar hot water systems were awarded to Conservation Technology of Billings with their Hyperion system.
13. A preliminary Energy Emergency Contingency Plan was developed to go along with the state guidelines.
14. Energy consumption data is recorded onto the computer in the budget office every month. The energy office reviews the monthly totals and keeps track of energy expenditures.
15. An extensive search for an insulating pool blanket led to the purchase of an Alta Products isomeric foam which should cut heating costs at the Municipal Pool by 50%.

16. Investigation into alternative fuels for the vehicle fleet shows advantages of propane and compressed natural gas, especially in relation to rising gasoline prices.
17. Heating systems analysis at the Courthouse, Library, Civic Center, Public Safety Center, Airport, and Community Center were conducted with specific recommendations made.
18. Estimates on many energy-saving measures have been secured for various buildings with cost-effective calculations figured in.
19. Testimony was given to the Montana Public Service Commission on proposed electricity and natural gas increases at public hearings in Helena.
20. A special analysis of street lighting costs and energy-efficiency changes was conducted by energy coordinators from around the state at meetings in Helena, Bozeman, and Butte, and efforts will be made to continue pushing for street lighting efficiency.
21. The promotion of energy conservation, recycling, local renewable energy development, and overall energy awareness has been emphasized throughout the course of the energy program.

#### Financial

1. An energy grant for \$20,000 was awarded to Butte-Silver Bow by the State Energy Office for 1981 (calendar year).
2. A supplemental grant for \$10,000 was awarded for the first six months of 1982, making the total from the State Energy Office \$30,000.
3. Various financing mechanisms have been investigated and researched for their applicability to projects in Butte-Silver Bow and to various communities around the state.
4. Participation in the Institutional Building Grants Program brought in \$950 to help defray the costs of energy audits on government buildings.
5. Energy audits conducted on all Butte Schools brought \$2800 into the Butte-Silver Bow Energy Office.
6. Financial support and in-kind support from the Montana Power Co., NCAT, the Human Resource Council, and the North American Indian Alliance, along with various departments of the Butte-Silver Bow Government, have all combined to further the efforts of the energy program.
7. Efforts are being made to identify all funding possibilities for different aspects of Butte-Silver Bow's energy activities for individuals, businesses, schools, non-profit organizations, and the local government.

## APPENDIX A

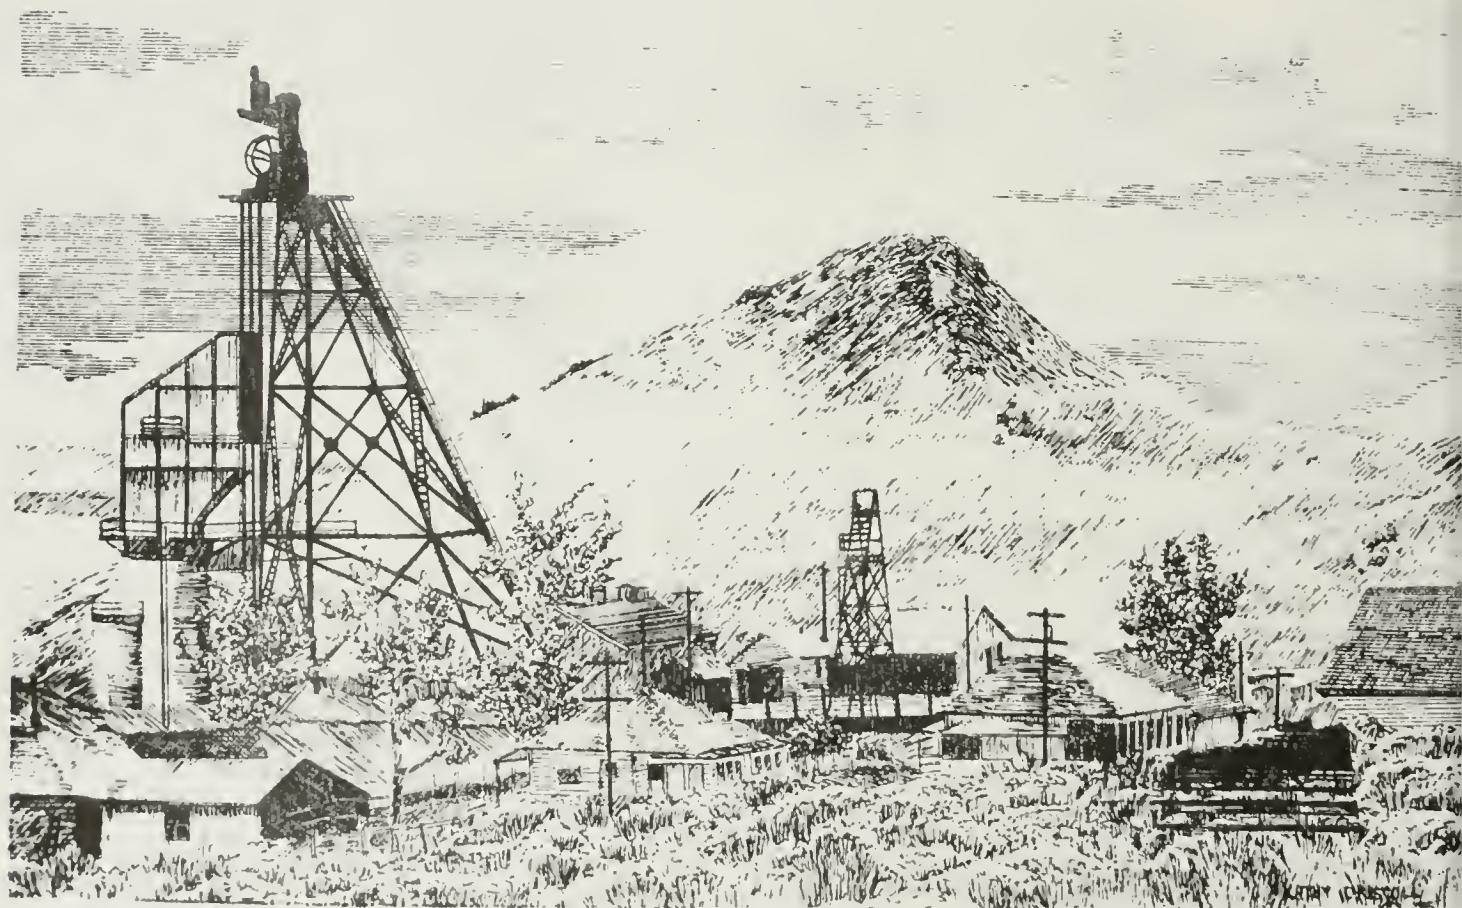

### BUTTE-SILVER BOW GOVERNMENT STRUCTURE

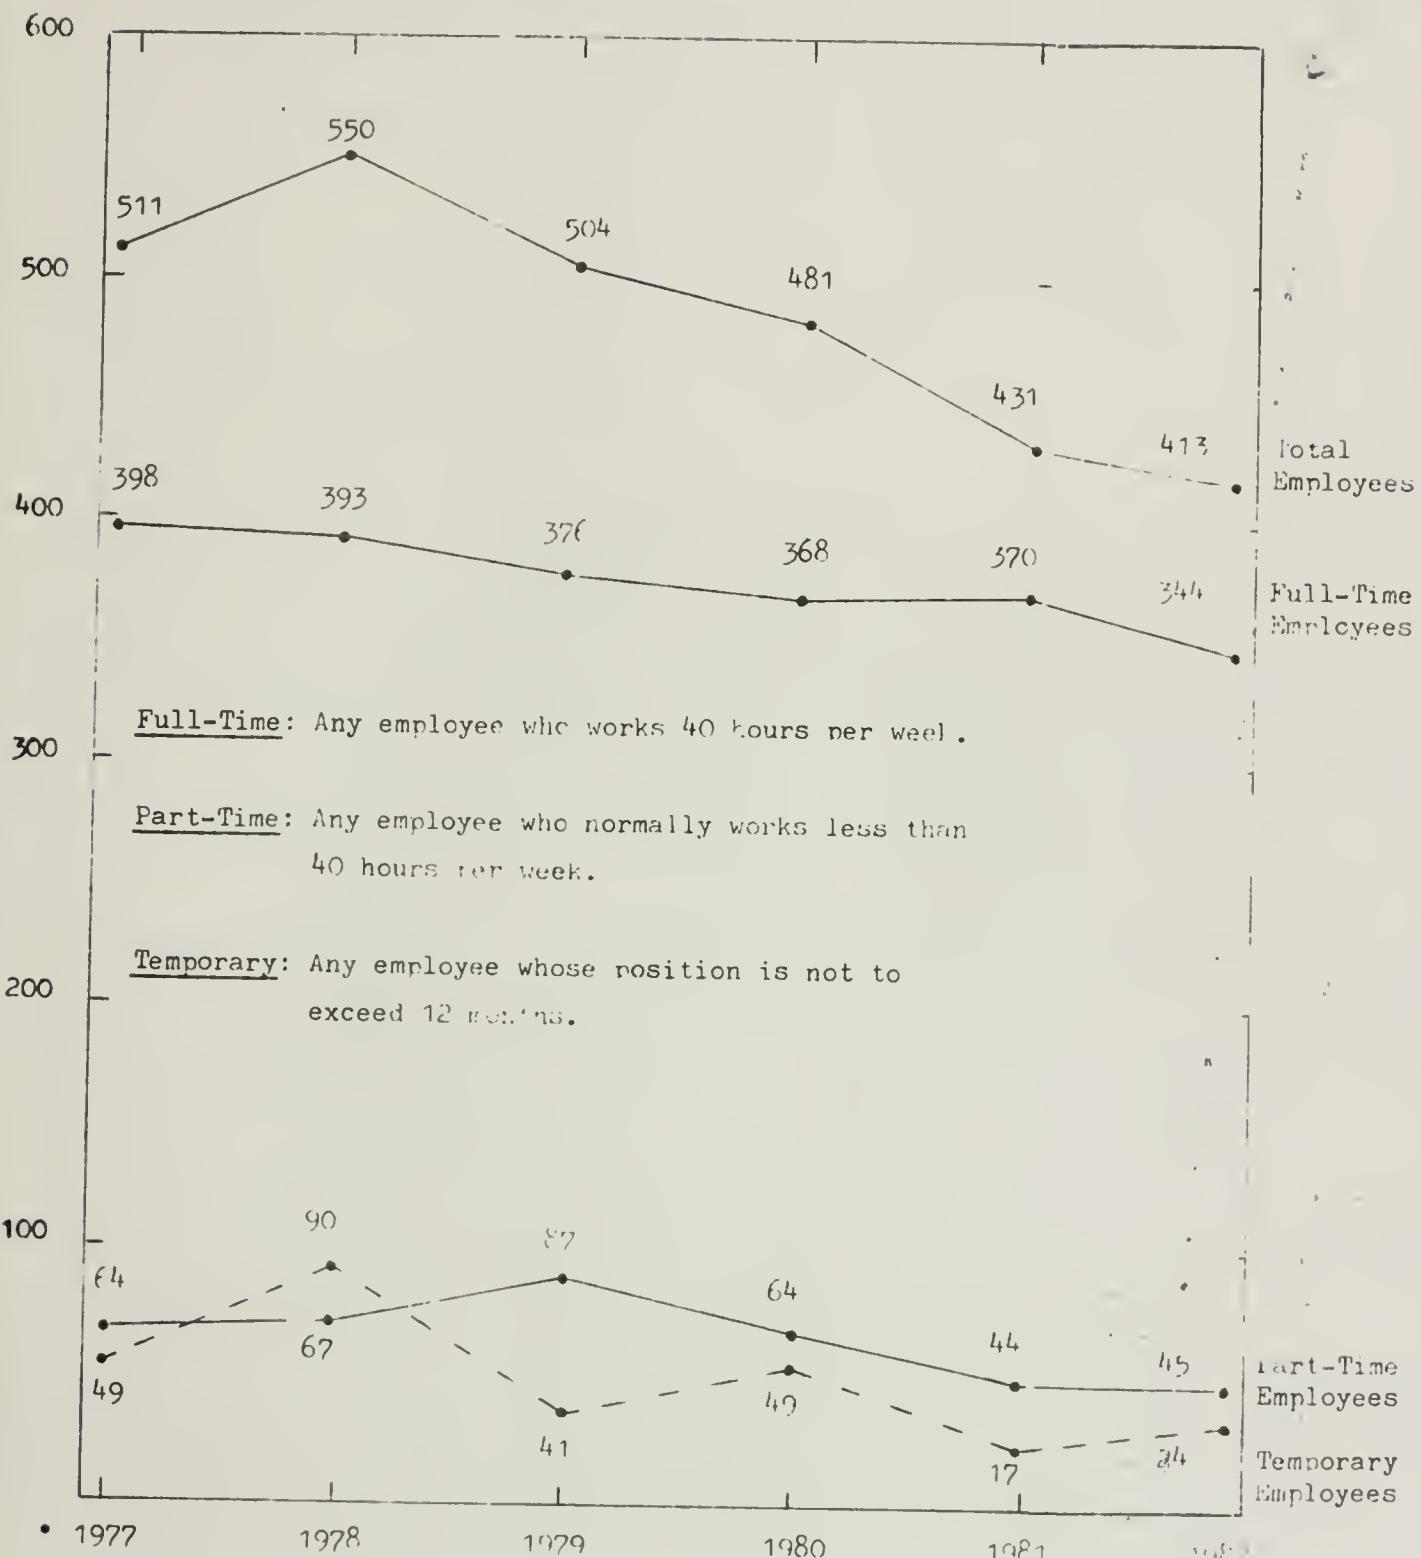

The Butte-Silver Bow Government was formed by consolidation in May 1977 when the city of Butte and Silver Bow County governments combined to create a more efficient local governing body. The total number of Butte-Silver Bow employees, with a breakdown for full-time, part-time and temporary, is presented in Appendix A-1 for the years 1977-1982, calculated for May of each year.

The Butte-Silver Bow operating budget has fluctuated very little over the past five years, as can be seen from the following figures:

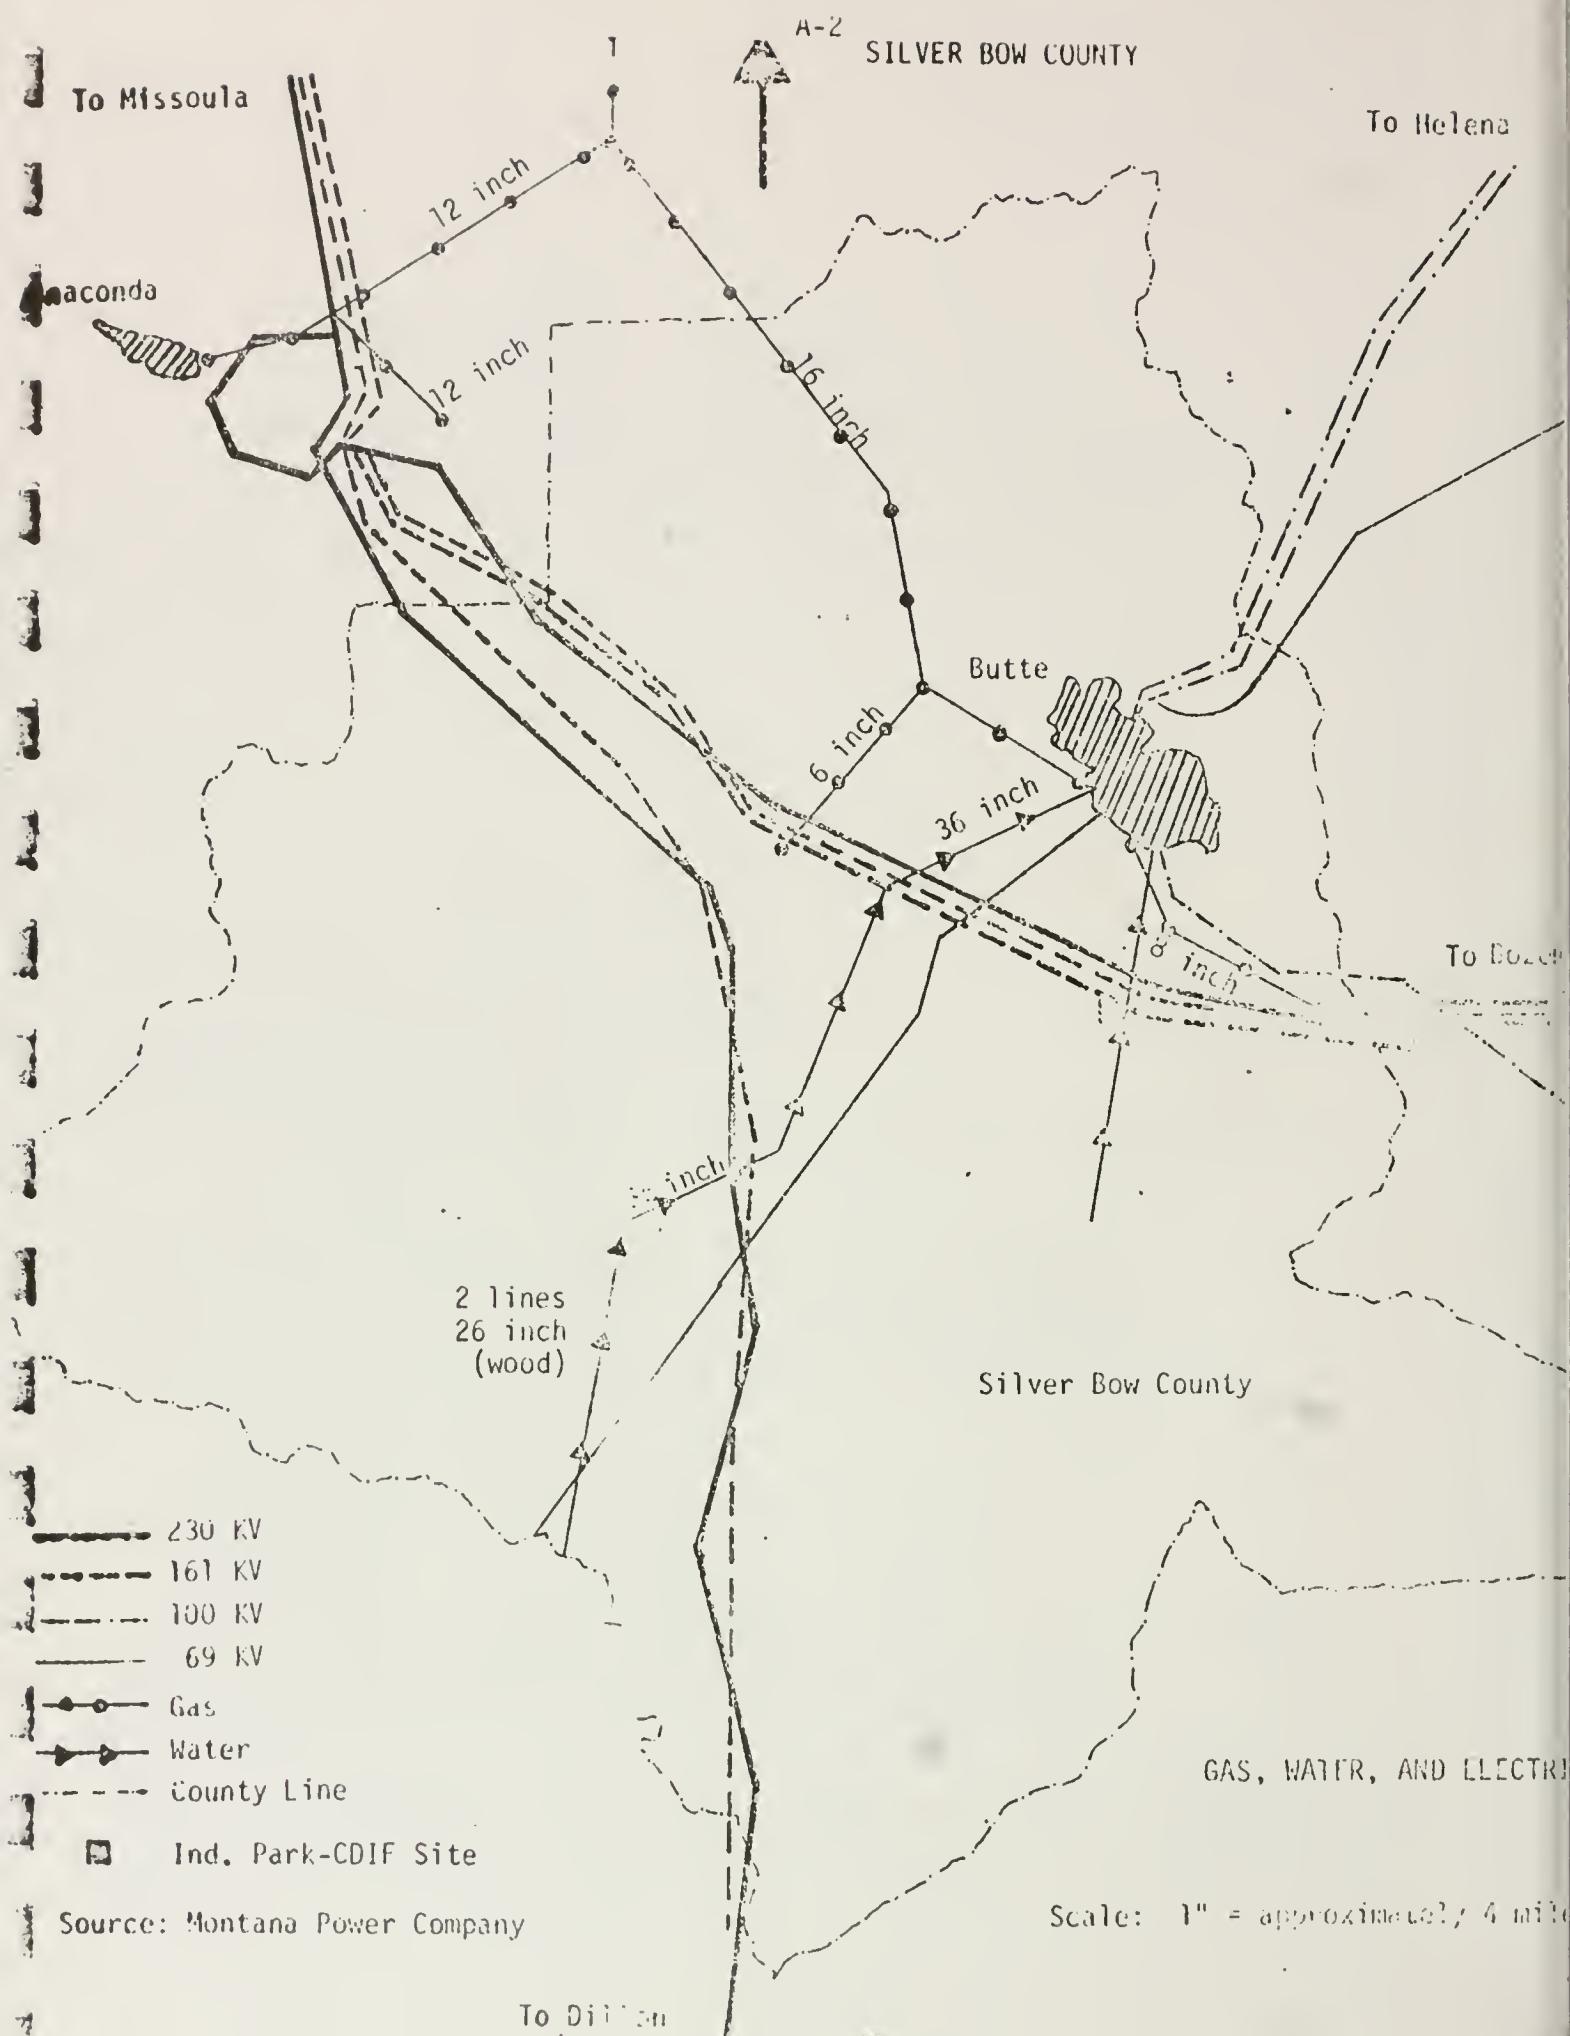

#### Fiscal Year

1977-78 :	\$14,201,173.14
1978-79 :	\$16,688,979.93
1979-80 :	\$15,870,621.53
1980-81 :	\$15,458,471.43
1981-82 :	\$14,849,620.00

BUTTE - SILVER BOW EMPLOYEES

\* Employee figures are calculated for May of each year.

## 1                   RESOLUTION NO. \_\_\_\_\_

2     A RESOLUTION ESTABLISHING AND APPROVING A COMPREHENSIVE ENERGY POLICY  
3     FOR THE COMMUNITIES OF BUTTE-SILVER BOW.

4     WHEREAS, energy is an integral part of society; and  
5     WHEREAS, energy costs to all sectors (Residential, Commercial, Indus-  
6         trial, Transportation, Government, Institutions and Non-Profit  
7         Organizations) continue to rise at an unprecedented rate and  
8         are expected to increase even more dramatically in the future;  
9         and

10    WHEREAS, existing fossil fuel reserves are limited and being depleted  
11         faster than new sources of energy are being developed; and  
12    WHEREAS, it being a proven, sound economical, ecological and socio-  
13         logical practice to incorporate energy conservation measures  
14         and to utilize sustainable energy sources wherever possible; and  
15    WHEREAS, it being in the best interest of the citizens of Butte-Silver  
16         Bow.

17    NOW, THEREFORE, BE IT RESOLVED BY THE COUNCIL OF COMMISSIONERS OF THE  
18         CITY AND COUNTY OF BUTTE-SILVER BOW, STATE OF MONTANA.

19    SECTION 1: That the policy of Butte-Silver Bow shall be to exemplify  
20         and foster wise energy use, particularly conservation  
21         measures, and the utilization of sustainable energy sources.

22    SECTION 2: That the Chief Executive is hereby empowered and authorized  
23         to execute and implement this policy in accordance with the  
24         laws of the State of Montana.

25    SECTION 3: This Resolution shall be in full force and effect from and  
26         after its passage and approval.

## APPENDIX B

### HEATING DEGREE DAYS

The term "Degree Days" is used to describe the average heating or cooling requirements of a certain area. A heating degree day accrues for every degree that the average outside temperature is below 65°F for a 24-hour period. For example, if the outside average air temperature is 30°F for a 24-hour period, then 35 degree days accrue because that is 35° less than 65°. It is assumed that if the outside temperature is 65°F or higher, then there is no heating requirements to keep the inside temperature at a comfortable level.

It is important to realize that the heating requirements in Butte-Silver Bow are among the highest in the continental United States. As can be seen from the following chart, Butte has the highest number of heating degree days of the 10 largest cities in Montana. The severe weather conditions are an integral part of the lifestyle and energy problems that are experienced in the Butte area. The higher the heating degree days outside, the more heat that is required to maintain a comfortable temperature on the inside.

B-1

### Heating Degree Days 30 Year Average

Anaconda	8414
Billings	7265
Bozeman	8165
Butte	<u>9719</u>
Great Falls	7652

Helena	8190
Missoula	7931
Miles City	7889
Kalispell	8554

HEATING DEGREE DAYS  
(Continued)

A closer look at monthly average heating degree days shows the months that are the most serious for heating purposes. Again, the higher the heating degree day number, the colder it is and the more heat that is required to maintain a 65°-70°F inside temperature.
